V. READING

1. Over 200 years ago, the term environmental pollution was quite strange to people. They lived healthily, drank pure water, and breathed clear air. Nowadays, the situation is quite different. People all over the world are excited about the things that are happening to the environment. Actually, it is man that is destroying the surroundings with many kinds of wastes. Everybody knows that motorbikes and cars emit dangerous gases that cause poisonous air and cancer, but no one wants to travel on foot or bicycle. Manufacturers know that wastes from factories make water and soil polluted, but no one wants to spend time burying it, it is worth talking a lot about pollution.

2. Tropical forests have provided us with many kinds of food, medicine and industry. They also reduce flood, keep water clean and slow down the Greenhouse Effect. However, the tropical forests are being destroyed to make rooms for farms and fields. Besides that, forest fires are the most terrible destruction. About 20 million hectares of forest are lost every year. The World Wildlife Fund is working to protect and save the forests which are in danger, to plant new trees and to slow the Greenhouse Effect. It encourages governments to think about the forests and their importance.

3. Air pollution is a serious problem in many cities. Motor vehicles, factories and other sources create so much air pollution that may hang in the air like dirty fog. Air pollution threatens the life of the people who live in cities. Although there isn't enough information on the effects of smoke in the atmosphere, doctors have proved that air pollution cause lung diseases. The gases from the exhausts of cars have also increased air pollution in most cities. If the gases in the atmosphere continue to increase, the earth's climate may become warmer. A lot of the ice near the pole may melt and may cause serious floods.

4. Air pollution occurs when wastes dirty the air. People produce most of the wastes that cause air pollution. Such wastes can be in the form of gases or particles of solid or liquid matter. These substances result chiefly from burning fuel to power motor vehicles and to heat buildings. Industrial processes and the burning of garbage also contribute to air pollution. Besides, there are other polluting substances that exist naturally in the air. They include dust, pollen, soil particles, and naturally occurring gases.

The rapid growth of population and industry and the increasing use of automobiles and airplanes have made air pollution a serious problem. The air we breathe has become so filled with pollutants that it can cause health problems. It also harms plants, animals, building materials, and fabrics.

5. Are you looking for a cheap, clean, effective source of power that doesn't cause pollution or waste natural resources? Look no further than solar energy. While most fuels now in use are being burned at an astonishing rate, solar energy or power from the sun, will last as long as the world lasts. This energy has already been used to heat and cool homes and to cook food. It has been used experimentally in radio batteries and in furnishing power for telephone lines. The devices, however, are cheap to operate but very expensive to produce.

6. Many people still believe that natural resources will never be used up. Actually, the world's energy resources are limited. Nobody knows exactly how much fuel is left. However, we also should use them

economically and try to find out alternative resources of power. According to Professor Marvin Burnham of the New England Institute of Technology, we have to start conserving coal, oil and gas before it is too late; and nuclear power is the only alternative. However, many people do not approve of using nuclear power because it is very dangerous. What would happen if there was a serious nuclear accident? Radioactivity causes cancer and may badly affect the future generations.
